

# **Calculation of reactive power regulation of solar inverter**

## Overview

---

**Abstract:** This paper proposes an analytical expression for the calculation of active and reactive power references of a grid-tied inverter, which limits the peak current of the inverter during volt-age sags. Reactive Power Compensation/ Reactive Power Regulation / Power Factor Correction, involves improving the power factor of an electrical system by reducing the reactive power drawn from the grid. To maintain grid stability and efficiency, many utility companies enforce a minimum power factor. 2005: FERC 661 requires a wind power factor range of  $\pm 0$ . 2016: FERC 827 requires all large non-synchronous generators to maintain a dynamic  $\pm 0.95$  at the high side of the project substation, at all generation levels. The key novelty is that the active/reactive power references are analytically calculated. String inverters offer flexible active and reactive power regulation capabilities, with an active load rate settable from 0% to 100%, and selectable active power overload output capacity of 1.
