Combined charging system standard

Overview

The Combined Charging System (CCS) is a charging station standard for plug-in electric vehicles that uses the Combo 1 (CCS1) or Combo 2 (CCS2) connectors, which are extensions of the IEC 62196 Type 1 and Type 2 alternating current (AC) connectors, respectively, each with two. The Combined Charging System (CCS) is a charging station standard for plug-in electric vehicles that uses the Combo 1 (CCS1) or Combo 2 (CCS2) connectors, which are extensions of the IEC 62196 Type 1 and Type 2 alternating current (AC) connectors, respectively, each with two. It is an extension of the J1772 standard AC charging connector. Connectors: Incomplete Combo 2 (left) showing the two large direct current (DC) pins below, while the four alternating current (AC) pins for neutral and three-phase are removed, while the signal pins of Type 2 remain, compared to IEC. In November 2022, Tesla adopted the communication standard of CCS and renamed it NACS, opening it up as a public standard. Then in May 2023, Ford announced plans to adopt it in future EVs, while nearly every other automaker followed by the end of the year. In September 2024, the J3400 standard was published by ISO/IEC and the relevant national standard of the Combined Charging System is a fundamental understanding for the Combined Charging System. The Guide explains and clarifies the. Charging standards are key technical specifications that ensure that electric vehicles can be charged safely and efficiently.
