

Lithium price crash

Overview

The lithium market is experiencing a major price decline due to rising supply and weaker demand. This is the lowest level since February 2021. Analysts expect further cuts in. Lithium carbonate prices have cratered more than 80% from their late-2022 peak as wave after wave of new supply hit the docks. Lithium mines from Australia's Pilbara region to Zimbabwe pushed global output 35% higher year-on-year — the sharpest surge on record. This dramatic fall comes even as demand for electric vehicles (EVs) and grid storage systems remains robust. According to Reuters and Oxford Institute.

Lithium price crash
