Micro inverter connected to photovoltaic

Overview

Microinverters are a type of solar inverter technology installed at each panel. Microinverters offer many benefits, such as rapid shutdown capabilities, flexibility for panel layouts, and panel-level monitoring and diagnostics. These unsung heroes of solar panel systems come in all shapes and sizes and contribute to the overall efficiency of your system. There are two main requirements for solar inverter systems: harvest available energy from the PV panel and inject a sinusoidal current into the grid in phase with the grid voltage. In order to harvest the energy out of the PV panel, a Maximum Power Point Tracking (MPPT) algorithm is required. This algorithm's job is to convert the DC (direct current) electricity produced in photovoltaic products like EcoFlow Solar Panels into the AC (alternating current) electricity that most homes and appliances need to run.
