Microgrid Replacement

Overview

Countries across Asia, Africa and Latin America are rapidly adopting solar microgrids to electrify remote regions that lack access to conventional grids, according to a microgrid market analysis. NLR has been involved in the modeling, development, testing, and deployment of microgrids since 2001. A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. By leveraging the latest technologies, microgrid owners can reduce reportable emissions, improve their microgrid's longevity, increase economic returns. For the last two years, one of my most interesting projects has been traveling to remote areas of California, working with Pacific Gas and Electric (PG&E) engineers to install microgrid systems as a permanent replacement for overhead distribution lines. The microgrid project is part of PG&E's. Therefore, local generation through microgrids can remove the need for transmission, avoiding large losses that greatly impact the system's stability and the cost of electricity.
