Photovoltaic panels that emit light

Overview

Solar lights harness solar energy through photovoltaic cells that convert sunlight into electrical energy. These cells are composed of semiconductor materials, typically silicon, which create a flow of electricity when exposed to sunlight. While solar panels can respond to certain types of artificial light, the output is minimal — far below what's needed to power a home or even charge a typical battery bank. Improving this conversion efficiency is a key goal of research and helps make PV technologies cost-competitive with.
