Smart Microgrid Project Background

Overview

Microgrids are gradually making their way from research labs and pilot demonstration sites into the growing economies, propelled by advancements in technology, declining costs, a successful track record, and expanding awareness of their advantages. Use smart microgrids to power communities with locally produced renewable energy—increasing self-sufficiency and reducing emissions at the same time. First, microgrids are hyperlocal, connecting a small. Microgrids are small-scale power grids that operate independently to generate electricity for a localized area, such as a university campus, hospital complex, military base or geographical region. Booth, Samuel, James Reilly, Robert Butt, Mick Wasco, and Randy Monohan. It will incorporate 20 buildings across the Clayton campus comprising 3.5 MW of demand, 1 MW of Solar photovoltaics, 1 MWh of battery storage, and 2 EV charging stations.
