Solar molten salt thermal power plant

Overview

Molten salts are ideal because they remain liquid at extremely high temperatures, have high thermal conductivity, and do not require high-pressure containment like steam, making the plant design safer and more efficient. The Crescent Dunes Solar Energy Project is a solar thermal power project with an installed capacity of 110 megawatt (MW) [4] and 1.1 gigawatt-hours of energy storage [1] located near Tonopah, about 190 miles (310 km) northwest of Las Vegas. By efficiently transporting and storing massive amounts of thermal energy, these fluids enable the conversion of heat into the high-pressure. The proposed thermal energy storage tanks are specifically designed and analyzed from an economic perspective for concentrated solar power plants. This technology is becoming more important for other technologies including nuclear power, thermal-electrical.
