Solar power generation fault indicator

Overview

The fastest and safest way to locate a fault is by using a solar ground fault locator, such as the Fluke GFL-1500 Ground Fault Locator. Solar photovoltaic array dc outputs are converted to ac using an inverter. The inverter output is stepped up through a transformer and distributed underground to junction. To effectively install a solar fault indicator, one must follow a series of distinct and technical steps that ensure optimal functioning and safety. If left undetected, ground faults can lead to inverter shutdowns. Reliability, efficiency and safety of solar PV systems can be enhanced by continuous monitoring of the system and detecting the faults if any as early as possible. This article will introduce common types of failures in PV systems along with their diagnosis and maintenance methods, helping users improve system efficiency and extend its lifespan.
