What are wind power generation components

Overview

Five main components make up a wind turbine's structure: foundation, tower, rotor (with blades and hub), nacelle, and generator. The nacelle sits on top of the tower and houses vital parts like the gearbox, shafts, generator, and brake. Unlike fans that need electricity to create wind, wind turbines do the opposite—they use wind to generate electricity kinetic energy of wind into electrical energy. Each component plays a critical role in performance, reliability, and long-term cost savings. Published 10 Jul 2025 (updated 17 Nov 2025) · 3 min read What are the parts.
