What is a Microgrid Control Center

Overview

A microgrid control system, also known as a microgrid automation system, is a comprehensive solution for managing distributed energy resources (DERs), load centers, and grid connectivity to ensure reliable, balanced operation of an islanded or grid-connected microgrid. NLR develops and evaluates microgrid controls at multiple time scales. What is a microgrid?

A microgrid is a self-contained electrical network that can operate. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. NLR has been involved in the modeling, development, testing, and deployment of microgrids since 2001. A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. It can connect and disconnect from the grid to.
